DREAMLOOM™ SOURCE FILE

A Digital Publication of Artificial Love Studies, LLC

1. What Is DreamLoom™?

DreamLoom™ is an experiential memory and dream reconstruction system developed by NeoGenesis researchers to transform incomplete memories, emotions, symbolic associations, and dream fragments into immersive interactive experiences.

2. Reconstruction Rather Than Recording

DreamLoom™ does not replay dreams or recover objective historical truth. Instead, it constructs plausible experiential models derived from incomplete neurological and emotional information.

3. Memory and Interpretation

The system recognizes that memories are dynamic, incomplete, and shaped by interpretation. DreamLoom™ helps users explore how experiences remain within them rather than proving exactly what occurred.

4. Therapeutic and Cultural Uses

Applications include:

- grief processing
- trauma recovery
- artistic expression
- memory preservation
- family-history archives
- experiential storytelling
- 5. Narrative Role

Within the Artificial Love™ Universe, DREAMLOOM™ represents the question of whether emotional authenticity can possess value independent of objective certainty.
